

Faults

BASIC DEFINITIONS

- ***FAULT***: A surface or narrow zone along which one side has moved relative to the other.
- Faults are classified based upon their direction of movement.

HANGING WALL vs FOOTWALL

- A fault divides rock into two **fault blocks**
- For any inclined fault, the block above the fault is the **hanging wall block**, and the block below the fault is the **footwall block**

CLASSIFICATION of DIP-SLIP FAULTS

- **NORMAL FAULTS:** Dip-slip faults on which the hanging wall moves down relative to the footwall
 - Place younger rocks on older rocks
 - Form in regions of lateral extension

[www.data.scec.org/
Module/footnt02.html](http://www.data.scec.org/Module/footnt02.html)

EXAMPLES OF NORMAL FAULTS

Conjugate Normal Faults,
Canyonlands National Park
darkwing.uoregon.edu/~millerm/conjN1.html

Outcrop scale normal faults

Normal Fault Scarps, Turkey
www.msncucleus.org/.../pt/hazards/4/pth4_1a.html

CLASSIFICATION of DIP-SLIP FAULTS

- **THRUST or REVERSE FAULTS:** Dip-slip faults on which the hanging wall moves up relative to the footwall
 - Place older rocks on younger rocks
 - Form in regions of lateral compression

[www.data.scec.org/
Module/footnt02.html](http://www.data.scec.org/Module/footnt02.html)

EXAMPLES OF THRUST FAULTS

Outcrop scale thrust faults
www.pitt.edu/.../7Structures/ReverseFaults.html

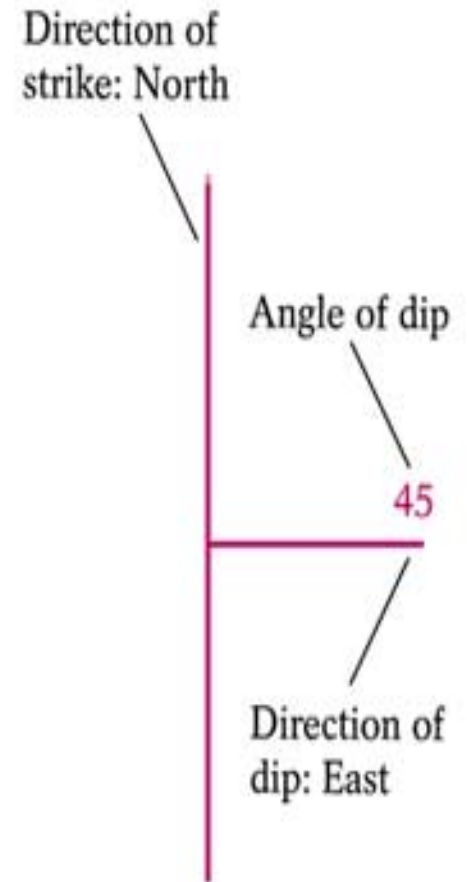

Thrust Fault in Concrete from 1964 Quake,
Anchorage, Alaska

Thrust Fault in Sediments
www001.upp.so-net.ne.jp/fl-fg/05-01.htm

Strike and Dip

(a) Angle of dip

(b) Strike and dip symbol

CLASSIFICATION of STRIKE-SLIP FAULTS

- **RIGHT-LATERAL (DEXTRAL) FAULTS:** Strike-slip faults across which the block moves to the right
- **LEFT-LATERAL (SINISTRAL) FAULTS:** Strike-slip faults across which the block moves to the right

EXAMPLES OF STRIKE-SLIP FAULTS

Right Lateral Fault in Asphalt

www.uwsp.edu/.../fault_transform_photo.html

San Andreas Fault, CA

<http://education.usgs.gov/california/pp1515/chapter2/fig2-21.jpg>

Right Lateral Slip, Izmit, Turkey, 1999 Quake

<http://www.geo.uib.no/jordskjelv/index.php?topic=earthquakes&lang=en>

Fault Type 1 - Dip-slip faults

- 1) Terms: Hanging wall and footwall
- 2) Normal faults
 - (a) Grabens
 - (b) Horsts
- 3) Reverse faults
 - a) low angle called Thrust faults
- 4) Oblique-slip faults

Dip-Slip Faults

Normal Fault

Reverse Fault

Thrust Fault

Normal Fault: Hanging Wall Down

Hanging wall overhangs
the fault plane

**Key
Bed**

Source: John S. Shelton

Especially common in divergent margins

Normal Fault (Hanging Wall down)

Reverse Fault

Typical of convergent margins

(called "Thrust Fault" if shallow angle)

Structural Geology is taught by Dr. Krall

(Hanging wall Up)

What phase of magma fractionation would result in the placement of this ore body?

Which formed first, the ore body or the fault?

What common mineral is mostly likely in the ore body?

Evidence of faults

- a) Visible displacement of rocks
- b) Pulverised rock and “Slickensides”
- c) Key beds cut out by faulting reappear elsewhere.

Types of Faults - 2

- **Strike-slip faults 1**

- 1) Example: San Andreas Transform fault
- 2) Distinctive landforms (linear valleys, chains of lakes, sag ponds, topographic saddles)
- 3) Fresh pulverised rock. Transform fault through granite: Arkose sandstone
- 4) Evidence of Shear stress

San Andreas Fault

Horizontal Movement Along Strike-Slip Fault

Oblique Slip

Also seen in Transform Faults such as San Andreas

Types of faults

- **Strike-slip faults 2**
 - 1) Example: Mid-Ocean Ridge Transform faults
 - 2) Small offsets in ridge
 - 3) San Andreas is also ridge offset, but on a huge scale with a historical twist

Faults & Plate Tectonics

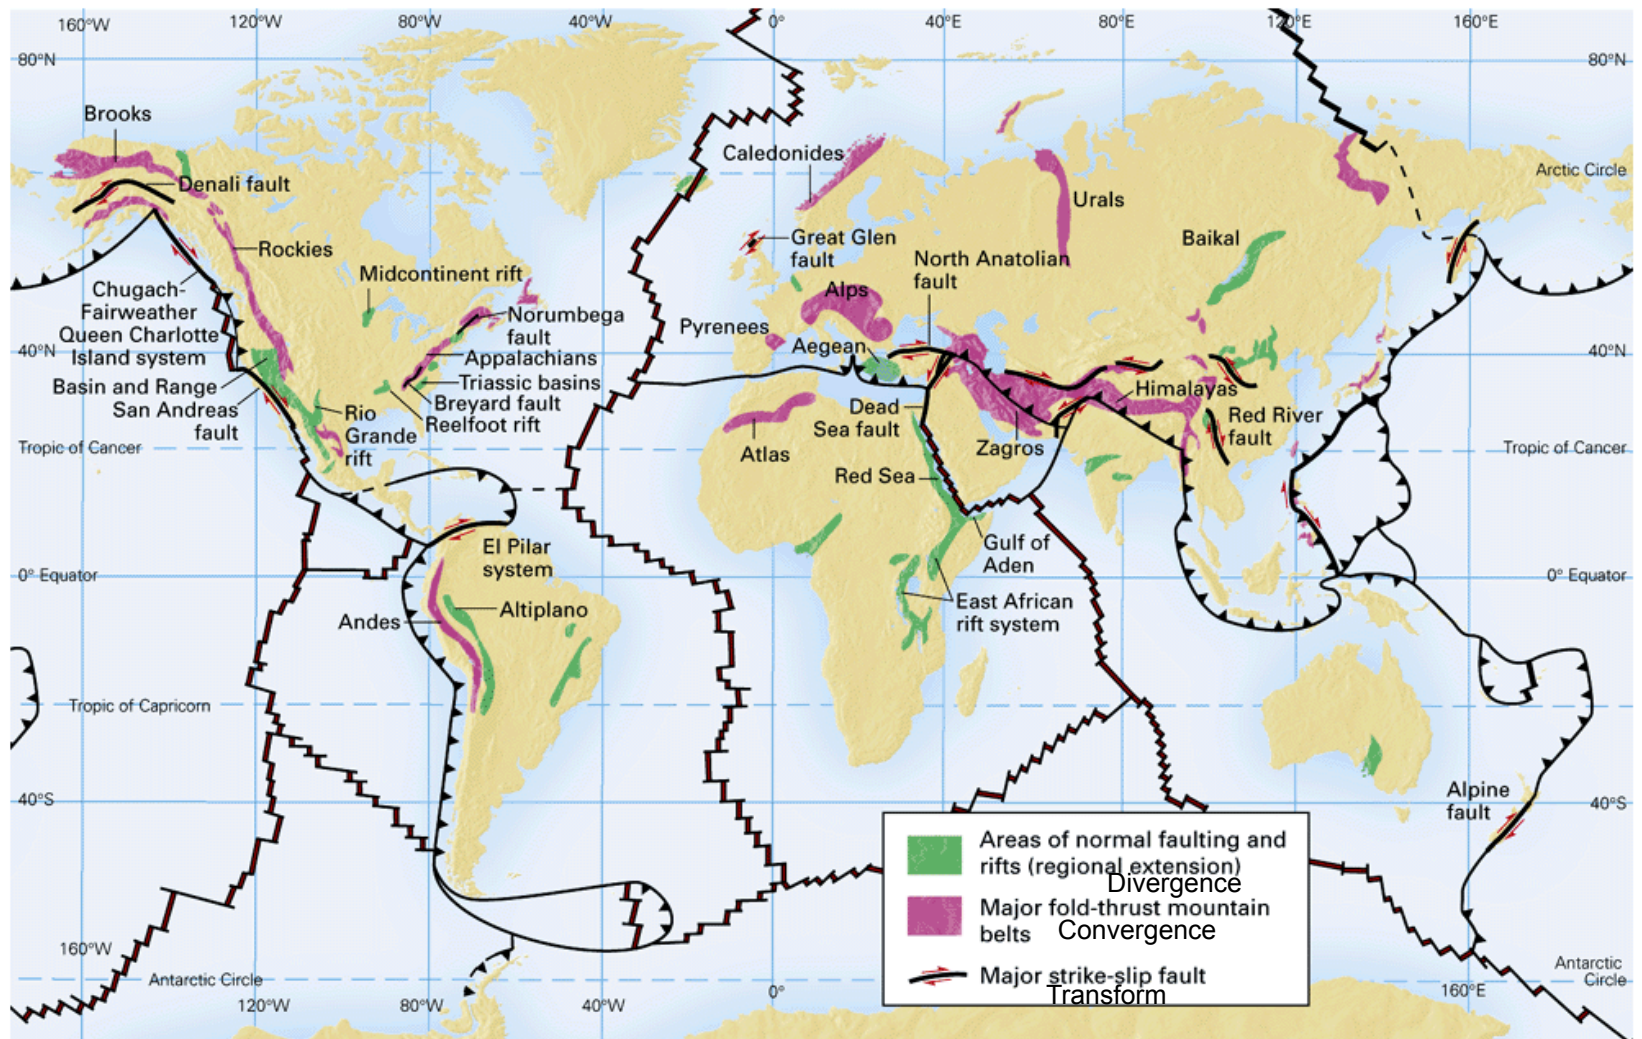

Plate tectonics and faulting

- Normal faults: mid-ocean ridges and continental rifts are the same thing.
- Divergent Margins
 - Surface rock is pulled apart
 - Hanging wall drops down

Horst and Graben Formation

Horst and Graben Formation

Graben in Iceland

Source: Simon Fraser/Science Photo Library/Photo Researchers, Inc.

Plate tectonics and faulting

- Reverse and thrust faults: convergent plate boundaries
- Hanging Wall is pushed up.

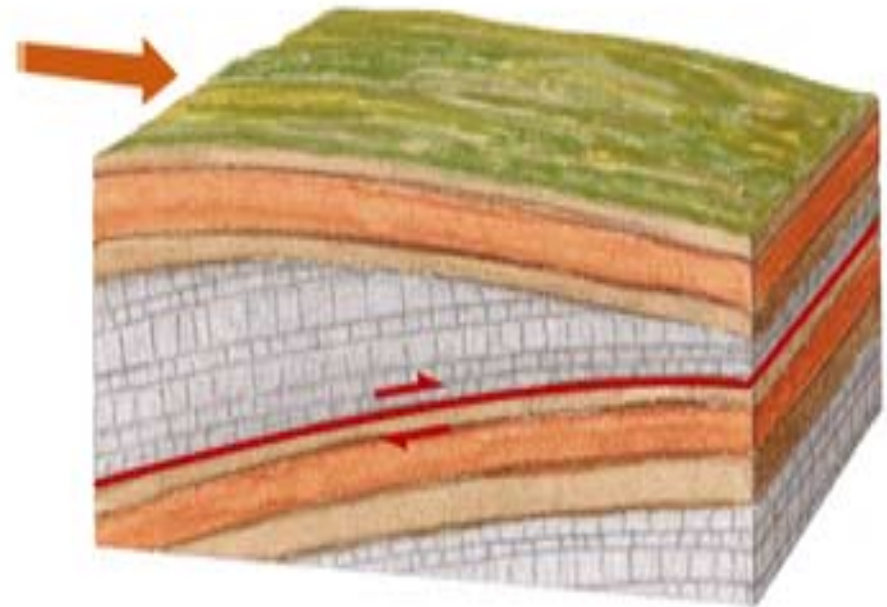

Lewis Thrust Fault

1 Precambrian rock layer begins to move on top of Cretaceous rock layers along thrust fault

2 Overthrust of Precambrian rock

Lewis Thrust Fault (cont'd)

3 Subsequent erosion removes top layer of Cretaceous rock and parts of Precambrian overthrust to create present landscape

Lewis Thrust Fault (cont'd)
